

# Construction Worker Safety Guide

Construction sites are dangerous places to be. There's a safety hazard awaiting innocent and unsuspecting workers in every corner. For this reason, clear and elaborate safety protocols have been put in place by agencies such as OSHA (Occupational Safety and Health Administration) to protect construction workers.

Currently, about 7 million Americans go to work at a construction site every day. Although construction has been a crucial sector in the U.S. economy for decades, construction worker safety is still a new and evolving concept. It wasn't until 1971 that agencies like OSHA (Organizational Safety and Health Administration) were formed. While tremendous steps have since been made to ensure construction workers are safe on the job, there's still a long way to go.

In this in-depth Worker Safety Guide, we're going to tell you everything you need to know about construction workplace safety, including anything that's not highlighted in the standard OSHA regulations.
