

Scaffolding Inspection Checklist

BENEFITS

Scaffolding is common equipment used in various industries, most notably construction, to give workers safe access to elevated areas. But scaffolding itself can pose a hazard to workers if, say, it isn't erected properly or is placed on uneven ground. So it's critical that you ensure that all scaffolding is inspected *before* workers use it.

HOW TO USE THE TOOL

Adapt this checklist for the scaffolding requirements in your jurisdiction's OHS laws. Require a supervisor or other "**competent person**" to use it to inspect all scaffolding to ensure that it complies with these requirements and is safe for workers to use.
